GAI-Tronics Limited provide communication products and systems for the Rail Sector to cover Trackside, On-board and Platform applications.

The Help Point Telephone increases the safety and efficiency of a **platform** area by giving easy access to Emergency and Information lines. The telephones provide hands free loudspeaking communication using autodial buttons connected to pre-programmed numbers.

Help Point at railway station

Help Point at level crossing

Help Point at remote country crossing

The GAI-Tronics Help Point Telephone is fully electronic, ruggedised and weather resistant. The telephone can be flush or surface mounted and is designed to be fixed to a vertical surface by vandal resistant tamper proof screws.

The option of SMART (Self Reporting And Monitoring Telephone) software allows the telephones' status to be remotely monitored for call and fault reporting. Constant access to this information, as well as the ability to reprogram the autodial button numbers from a remote location at any time allows real time troubleshooting.

The Help Point telephone is already in use on many of Britains Railway Stations, and GAI-Tronics are able to customise their products to suit most requirements.

The InformationPoint is a versatile help point telephone in a distinctive 2.2M high enclosure. It provides a dual function as a simple telephone or a self-contained customer information system. The option of a LCD screen indicates call progress and other useful information.

In addition to telephone facilities, the InformationPoint incorporates a cost-effective public address (PA) solution. The PA is activated either when the customer presses the information button, or when remotely requested to do so via a standard telephone connection at the monitoring station, and can provide either stored or real time information.

InformationPoint

Whatever your requirements, GAI-Tronics can provide you with an effective communication solution.
